

Bee AI

Framework

WHAT

An open-source toolkit for building agents and multi-agent systems that go beyond simple prompting — with deterministic behavior, not just suggestions.

Positioning

An orchestration & control layer

— not just a prompting library

Production-ready focus

— built for governed, auditable agent behavior

Full Python + TS parity

— same concepts, both ecosystems

HOW

Declarative requirements instead of implicit prompt engineering

Backend

Unified interface to any LLM provider

RequirementAgent

The agent itself

Requirements

Deterministic constraints on behavior

Tools + Handoff

Agent actions & delegation to other agents

Emitter

Every agent action emits an event

Middleware

Plug in behavior without touching the agent

TRADE-OFFS

Pros

- **Deterministic constraints**
- **Native observability**
 - ◆ OpenTelemetry
- **Real Python/TS parity**
- **MCP & A2A native**

Cons

- **Small community**
- **Steeper mental model**

"More orchestrator than full multi-agent framework"

COMPARISONS

	BeeAI	LangGraph	CrewAI
Mental model	Declarative requirements	Explicit state graph	Role-based teams
Entry curve	Medium	High	Low
Languages	Python + TS	Python (+JS)	Python
Best for	Controlled, auditable behavior	Complex conditional workflows	Fast role-based prototypes

DEMO

```
1  const devAgent = () => {
2    return new RequirementAgent({
3      llm: await getLLM(),
4      tools: [new ThinkTool()],
5      instructions: `You are a senior developer....`,
6      requirements: [
7        new ConditionalRequirement(ThinkTool, {
8          forceAtStep: 1,
9          maxInvocations: 3
10       }),
11     ],
12   });
13 }
```
